Trigonometry Problems

Ex 1.

It takes 10 mins to walk to Bob's house and 6 mins to walk to the shop. How much longer will it take to walk to Bob's house via the shop?

$$
\text { by Pythagoras: } \quad \begin{aligned}
& \mathrm{r}=\operatorname{sqrt}\left(\mathrm{x}^{2}+\mathrm{y}^{2}\right) \\
& \mathrm{x}^{2}+\mathrm{y}^{2}=\mathrm{r}^{2} \\
& \mathrm{x}^{2}=\mathrm{r}^{2}-\mathrm{y}^{2} \\
& \\
& \mathrm{x}=\operatorname{sqrt}\left(\mathrm{r}^{2}-\mathrm{y}^{2}\right) \\
& \\
& \\
& y=\operatorname{sqrt}\left(\mathrm{r}^{2}-\mathrm{x}^{2}\right)
\end{aligned}
$$

$$
\begin{aligned}
y & =\operatorname{sqrt}\left(r^{2}-x^{2}\right) \\
& =\operatorname{sqrt}(100-36) \\
& =\operatorname{sqrt} 64 \\
& =8 \mathrm{mins}
\end{aligned}
$$

ie it will take $8+6=14 \mathrm{mins}$

## Ex. 2

A road has a gradient of $1: 5$. What is the angle in degrees?
$\tan =$ opposite $/$ adjacent $=5 / 1=5$

5
$\tan ^{-1}=11.3^{\circ}$
